10 . Jo dikhta hai , woh bikta hai

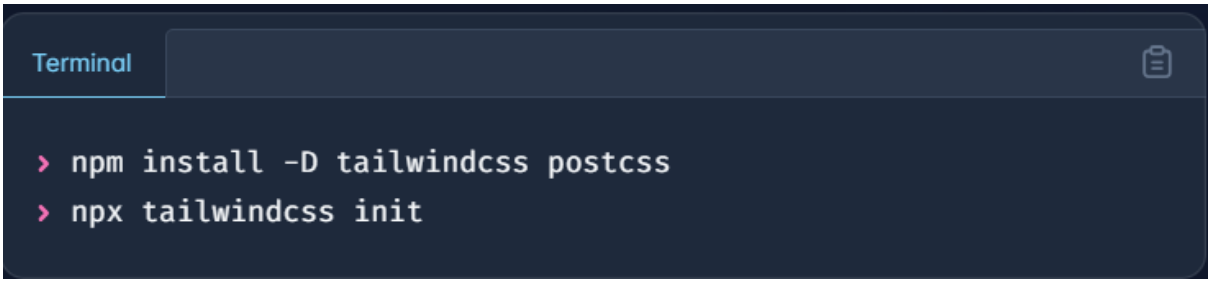
Ways to write CSS

1.Normal css (that we using)
2.Sass
3.Scss
4.Styled components
5.Tailwind
6.Different libraries and framework
    1.Material UI
    2.Bootstrap
    3.Chakra UI
    4.Ant design

Latest framework Tailwind

Just installing tailwind following this steps
https://tailwindcss.com/docs/guides/parcel

1. Run this commands on terminal



Run this command on terminal so it will install 2 packages for us
1. Tailwind css
2. Post css

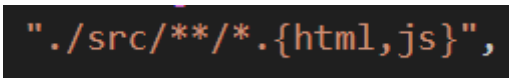
Here we did npx tailwindcss when we do this it will create tailwind.config.js file

2. Create .postcssrc file (is config for post css)
3. Write this in .postcssrc file

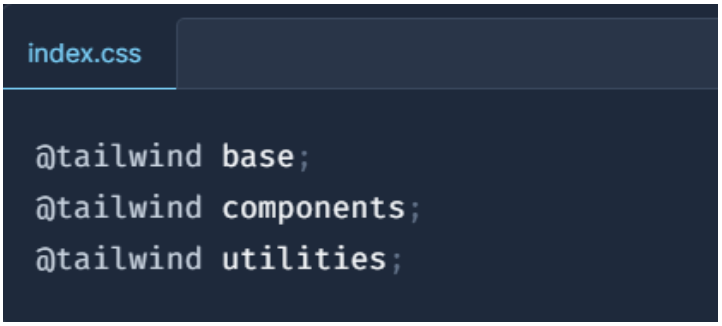
Now complete the config for tailwind

4. Inside content we need to write this (tailwind.config.js file)

We only using html & js file so we can put only that also it's fine



5 . write only this three line inside index.css file



Then we never touch index.css file 😅

Our project Now config to use tailwind

Tailwind CSS gives className for every css that we can put inside the our app

Classes

width = w-
Padding = p-
Margin = m

Install this extension for tailwind class suggestion

If we want specific value of css then we need to write hardcoded value inside []

```
<img className="logo w-[80px] mx-2 items-center"
src={LOGO_URL} alt="" />
```
